Enterprise Lead Management Master Blueprint Part 6 – Enterprise Automation & Pipeline Orchestration

Purpose

Design the enterprise automation layer that orchestrates every workflow from WhatsApp ingestion to dashboard updates using an event-driven architecture.

Enterprise Automation Architecture

Sales Representative → WhatsApp Business → Meta WhatsApp API → Automation Trigger (n8n / Composio) → Pipeline Orchestrator → AI Extraction → Validation → Duplicate Detection → Databricks → Lead Enrichment → Representative Matching → Notification Engine → Quip Sync → Dashboard Refresh.

Pipeline Orchestrator

The Pipeline Orchestrator is the central workflow engine. It receives events, coordinates services, executes sequential and parallel tasks, maintains execution state, retries failures, records audit logs, prevents duplicate processing (idempotency), supports manual replay and exposes execution metrics.

Pipeline Execution Flow

1. Receive WhatsApp event. 2. Create execution ID. 3. Store raw payload. 4. Invoke Claude extraction. 5. Validate. 6. Duplicate detection. 7. Persist to Databricks. 8. Enrich lead. 9. Match representative. 10. Sync Quip. 11. Refresh dashboard. 12. Send notifications. 13. Record audit trail.

Pipeline Monitoring Dashboard

Display Pipeline ID, Workflow Name, Lead ID, Trigger Source, Current Stage, Duration, Success/Failure, Retry Count, Error Details, Assigned Representative, Start/End Time and Execution History.

Retry & Recovery

Retry transient failures up to three times using exponential backoff. Failed executions move to a Dead Letter Queue for administrator review. Support manual replay and automatic recovery.

Event Bus

Standard events: LeadCreated, LeadUpdated, LeadAssigned, LeadEnriched, ReminderTriggered, ReminderEscalated, DashboardRefreshed, NotificationSent, CSVUploaded, PipelineFailed.

Scheduler

Hourly reminder checks, daily KPI aggregation, dashboard refresh, CSV synchronization, weekly summaries, monthly analytics and housekeeping jobs.

Integration Layer

Integrate Meta WhatsApp API, n8n, Composio, Databricks, Quip, React Dashboard and future ERP/CRM systems through well-defined interfaces.

AI Decision Engine

Centralize lead scoring, representative assignment recommendations, priority calculation, next best action, sentiment analysis, executive insights and forecasting assistance.

Operations Dashboard

Provide pipeline health, workflow success rate, queue lengths, processing times, SLA compliance, integration health, AI metrics and system alerts for administrators.
