Enterprise Lead Management Master Blueprint Part 7 – AI Services, Prompt Library & Intelligent Decisioning

Purpose

Define the AI layer that powers lead extraction, enrichment, scoring, representative recommendations, reminders, summaries and executive insights.

AI Architecture

Create modular AI services: Lead Extraction Service, Validation Assistant, Duplicate Detection Assistant, Lead Enrichment Service, AI Decision Engine, Executive Insights Generator and Conversational Analytics Service.

Lead Extraction Prompt

Design a production prompt that extracts structured lead information from both structured and free-form WhatsApp messages, returning JSON with confidence scores and missing-field detection.

Validation Prompt

Validate mandatory fields, identify malformed values, suggest corrections and classify records as Valid, Draft or Requires Review.

Duplicate Detection Prompt

Compare incoming leads with Databricks records using phone, company, contact, email and fuzzy matching. Return a confidence score and merge recommendation.

Lead Enrichment Prompt

Classify industry, customer type, product category, deal size, buying probability, risk score and recommended priority. Explain the reasoning for every enrichment.

Representative Recommendation

Recommend the best representative based on CSV mappings, workload, territory, products, language and historical ownership. Return top three candidates with confidence scores.

Next Best Action

Generate actionable recommendations such as 'Send quotation', 'Schedule follow-up', 'Escalate', 'Request missing information' or 'Mark as Won/Lost' based on lead state.

Executive Insights

Generate daily and weekly summaries covering pipeline health, high-risk opportunities, SLA breaches, top performers, bottlenecks and forecast trends.

AI Governance

Log every AI decision, prompt version, model version, confidence score and human override. Support prompt versioning, evaluation metrics and feedback loops for continuous improvement.
